---

Summary

Software Engineer (Systems Engineering, UNICEN, 2026) with a full stack and applied AI profile. I ship production web apps and LLM features backed by measurement: a tournament platform adopted by a 13-university league, a local-first RAG assistant with its own evaluation harness, and a multi-agent pipeline with round-trip tested output.

Experience

Full Stack Developer — LIDE 2, official platform of the RedUNCI inter-university League of Legends tournament · August 2026 – September 2026

Self-initiated project adopted as the tournament's official platform: 113 registered players across 20 teams from 13 universities. Built and deployed to production (Vercel + Supabase with Row-Level Security) the standings, fixtures, playoffs and detailed player and team profiles, plus a match replay parser that produces professional-style match statistics for players to analyse their game. https://lide2.vercel.app/

Tech Stack: Next.js, React, TypeScript, Tailwind CSS, Supabase (PostgreSQL, Auth, Storage, RLS), Vercel.

Machine Learning Researcher — Undergraduate thesis, UNICEN · March 2025 – June 2026

Comparative study (co-authored with a classmate, supervised by a CONICET researcher) of automatic fall detection from video: benchmarked 4 human pose estimators (AlphaPose, OpenPose, MediaPipe, YOLOv8-pose) and CNN-LSTM / TCN-Transformer / Transformer architectures over 4 public datasets (~1,600 videos) with automated experimentation and benchmarking pipelines. Key finding: pose estimation dominates detection latency — YOLOv8-pose was the fastest estimator on every dataset and OpenPose the slowest.

Tech Stack: Python, TensorFlow, PyTorch.

MapBox Developer — CityLab, University Center for Citizen Innovation, UNICEN · April 2023 – December 2023

University project with the CityLab team at the University Center for Citizen Innovation (UNICEN): features for the Cultural Spaces Map.

Tech Stack: JavaScript, MapBox.js.

Projects

Rekindle — personal project · October 2026 – Present

Local-first assistant that connects what the user reads with what they write: it ingests web articles and YouTube videos, summarizes them, compares them against an Obsidian vault and proposes actions.

Two-stage retrieval: a pgvector pre-filter (the 3 closest projects) plus an LLM evaluation that answers with schema-validated JSON; provider chain with fallback (DeepSeek, Gemini, local Ollama) and stale-suggestion detection via vector drift.

Custom evaluation harness over a hand-labeled dataset: Precision@K, Recall@K, triage F1 and quality gates that catch regressions when prompts or models change. On 376 hand-labeled article × project pairs (56 real connections), the default model is right 95% of the time it flags a pair as an actionable connection, it recovers 35 of the 56 real connections, and it proposes 4 extra links; median latency 1.8 s per pair (one labeler, small dataset; how useful the suggestions are is not measured).

Per-token cost and latency telemetry; 81 test files, 40 of them against a throwaway PostgreSQL with pgvector in a Testcontainer.

Tech Stack: TypeScript, Node.js, Fastify, PostgreSQL + pgvector, Drizzle ORM, pg-boss, Ollama (bge-m3), Gemini API, Docker, Vitest, GitHub Actions.

Repository: github.com/Corcholog/rekindle

My Merry May — Spanish fan translation of a PS2 visual novel — personal project · October 2026 – present

Reverse-engineered the game's script format and executable (ELF32 MIPS; the text pointers are relocated in place so the bytecode never moves) and built the tooling around it: a screen simulator that lays out every screen as the game draws it, and round-trip tests that rebuild the 8 script files byte-identically.

Ran the translation through a five-agent pipeline — scout, translator, automatic checks, reviewer, human review — with shared memory across batches: a style guide, a story bible and per-script scouting notes. 12,537 of 33,135 entries translated (37.8%); the reviewer agent changed 6.5% of 11,285 draft lines, mostly for naturalness and fidelity.

Tech Stack: Python, Pillow, pytest, multi-agent LLM workflow (Claude Code).

Repository: github.com/Corcholog/mmm-spanish-patch (tools and docs only; no game data).

Education

- **B.Eng. in Systems Engineering** — UNICEN, Tandil · March 2021 – June 2026
- **Advanced Full-Stack Developer Certification (scholarship)** — ITBA · September 2025 – December 2025
- **Diploma in Esports** — UNLP · April 2026 – October 2026

Languages

- Spanish (native)
- English C2 - EF SET English Certificate, Score 75/100

Skills

- **AI and ML:** LLMs in production (schema-validated JSON, provider fallback), embeddings and retrieval (pgvector), eval harnesses (Precision@K, Recall@K, F1), prompt regression testing, YOLO, OpenCV, PyTorch, TensorFlow
- **Languages:** TypeScript, JavaScript, Python, SQL
- **Frontend and backend:** React, Next.js, Node.js, Fastify, REST APIs, Zod
- **Data:** PostgreSQL (Row-Level Security, Drizzle migrations), pgvector, Supabase, job queues (pg-boss)
- **Quality and DevOps:** Vitest, Testcontainers, GitHub Actions, Docker, Vercel, Git
