Summary

Systems Engineer (UNICEN, 2026) with a full stack and applied machine learning profile. I build production web apps and integrate LLMs, measuring their quality with evals, metrics and regression tests.

Experience

Full Stack Developer — LIDE 2, official platform of the RedUNCI inter-university League of Legends tournament · August 2026 – September 2026

Self-initiated project adopted as the tournament's official platform. Built and deployed to production standings, fixtures, playoffs, detailed player and team profiles, and a match replay parser.
Repository · Web

Tech Stack: Next.js, React, TypeScript, Tailwind CSS, Supabase (PostgreSQL, Auth, Storage, RLS), Vercel.

Machine Learning Researcher — Undergraduate thesis, UNICEN · March 2025 – June 2026

Comparative study of fall detection using human pose estimation and Deep Learning, supervised by a CONICET researcher. Evaluated pose estimators and architectures (CNN-LSTM, TCN-Transformer, Transformer) with automated experimentation and benchmarking pipelines.

Tech Stack: Python, TensorFlow, PyTorch.

MapBox Developer — CityLab, Tandil · April 2023 – December 2023

Built features for the Cultural Spaces Map with the University Center for Citizen Innovation team.

Tech Stack: JavaScript, MapBox.js.

Projects

Rekindle — personal project · October 2026 – Present

Local-first assistant that connects what the user reads with what they write: it ingests web articles and YouTube videos, summarizes them, compares them against an Obsidian vault and proposes actions. Only accepted suggestions are written back to the vault. Two-stage retrieval (pgvector pre-filter + LLM evaluation with Structured Outputs), LLM provider chain with fallback (DeepSeek, Gemini, Ollama) and stale-suggestion detection via vector drift. Custom eval harness with a hand-labeled dataset, retrieval

metrics (Precision@K, Recall@K) and classification metrics (F1), plus quality gates that catch regressions when prompts or models change. Cost and latency telemetry; integration tests with Testcontainers.

Tech Stack: TypeScript, Node.js, Fastify, PostgreSQL + pgvector, Drizzle ORM, pg-boss, Ollama (bge-m3), Gemini API, Docker, Vitest, GitHub Actions.

FollowUP — university course project · March 2025 – April 2025

Full stack app for real-time person detection and tracking across multiple video sources, with behavior pattern analysis and group detection.

Tech Stack: Next.js, React, FastAPI, Python, YOLOv8n, WebSockets.

Education

- **B.Eng. in Systems Engineering** — UNICEN, Tandil · March 2021 – June 2026
- **Advanced Full-Stack Developer Certification** — ITBA · September 2025 – December 2025
- **Diploma in Esports** — UNLP · April 2026 – October 2026

Languages

- Spanish (native)
- English C2 - EF SET English Certificate, Score 75/100

Skills

- **Languages:** TypeScript, JavaScript, Python, SQL
- **Frontend and backend:** React, Next.js, Node.js, Fastify, REST APIs, Zod
- **Data:** PostgreSQL (Row-Level Security, Drizzle migrations), pgvector, Supabase, job queues (pg-boss)
- **AI and ML:** LLMs in production (Structured Outputs, provider fallback), embeddings and retrieval, eval harness, prompt regression testing, YOLO, OpenCV, PyTorch, TensorFlow
- **Quality and DevOps:** Vitest, Testcontainers, GitHub Actions, Docker, Vercel, Git, Claude Code
